# displaying object
ostracod_plot

```

d)

```

# create multipanel figure
salinity / (copepods + ostracod_plot)

```

e)

Copepods are more abundant than ostracods at these sites: Devreux Creek, North of Venoco Bridge, Phelps Road, and South of Venoco Bridge.

It does not appear that ostracod abundance relates to site-level differences in salinity. At South of Venoco Bridge salinity is high while abundance is low however at North of Venoco Bridge both salinity and abundance are high.

2. Visualizing total abundance as a function of salinity

a)

- x-axis: med_sal
- y-axis: log_ave_lit
- color: taxon
- geometry: geom_point()
- facets: facet_wrap(~ taxon, scales = "free")

b)

```
# creating new object from clean aquatic inverts
aq_ins_salinity <- aq_ins_clean |>
  # create log + 1 transformed average abundance per liter
  mutate(log_ave_lit = log(ave_lit + 1),
    # make taxon names title case
    taxon = taxon |>
      str_replace_all("_", " ") |>
      str_to_title() )|>
  # order taxon levels by maximum abundance
  mutate(taxon = fct_reorder(taxon, ave_lit, .fun = max, .desc = TRUE)) |>
  # keep columns needed for figure
  select(taxon, ave_lit, log_ave_lit, med_sal, site_full)

# display 10 random rows
aq_ins_salinity |>
  slice_sample(n = 10)
```

```

d)

For Annelida Polychaete, Annelida Oligochaete, and Nematode, not much can be said for the relationship between abundance and salinity due to a lack of data. For Copepod and Ostracods it seems that both species are the most abundant at low mean salinities. It also seems that Copepods are more resilient to higher salinities because their abundance remains high even past 60 ppt while Ostracod abundance decreases. Diptera Chironomid are only abundant at low salinities and Boatmen have similar abundances across all salinities.
